- Highly accurate data models
- Meets real-world needs within the organization

### Successful Application Development means:

- Adhering to Accepted Client Standards
- Utilizing Open Architectures
- Appropriate Technology Implementation
- Attention to application security models

### Successful Application Deployment means:

- Point-and-Click Installation Procedures
- User Training
- On-Line Help
- Compatibility with existing systems and software

## TECHNOLOGY

We at ATB Consulting, Inc., keep abreast of the latest developments in computer technologies. We are able to provide a smooth transition of advanced client-server technology into your organization with maximum results.

Technological changes are fast — and almost nowhere are these changes more rapid than in computer information systems. ATB's experience with complex systems development gives us insight into the successful implementation of technology into your enterprise, without sacrificing future data migration ease — as proprietary systems often do.

Utilizing the appropriate technology-model for the application and business-needs will assure that the result works within the framework of the organization and enhances the business-process it was designed to aid.

We also realize that technology is only a part of the solution. Correctly applied, it becomes the great enabler for any application. At ATB, we recognize that technology makes the application work.

## BUSINESS

ATB Consulting, Inc., recognizes the most important aspect of any application — the business. This occurs at several important levels.

First, business analysis is performed to define the intelligence that is transferred to the application. Our background in manufacturing allows ATB to identify the key aspects of your business that will promote application usefulness and success.

Second, the impact of the application on the current and future business practices must be identified. Applications are always the agents of change. The ability to gauge the implications of a new application on your business is often the greatest determination of success.

Finally, a solution that fits the needs of the specific business need must be able to bring benefit to the organization it serves, and promote the function it is serving.

A successful application enhances your business and is flexible in meeting your needs.
